Lattice $\mathcal{N} = 4$ Supersymmetric Yang–Mills

David Schaich (Bern)

Nonperturbative and Numerical Approaches
to Quantum Gravity, String Theory and Holography
International Centre for Theoretical Sciences, Bangalore
31 January 2018

Overview and plan

Goals: Reproduce known results in
perturbative, holographic, etc. regimes

Then use lattice to access new domains

Quick lattice $\mathcal{N} = 4$ SYM recap

(I) Dimensionally reduced (2d) thermodynamics

(II) 4d static potential Coulomb coefficient

(III) Anomalous dimension of Konishi operator

Open questions and future directions

Lattice supersymmetry in a nutshell

Motivation: Non-perturbative insights from first-principles lattice calcs

Obstruction: $\left\{ Q_\alpha^I, \overline{Q}_{\dot\alpha}^J \right\} = 2\delta^{IJ}\sigma_{\alpha\dot\alpha}^\mu P_\mu$ broken in discrete space-time

$\Longrightarrow$ Relevant susy-violating operators, typically too many to fine-tune

Solution: Preserve susy sub-algebra at non-zero lattice spacing

Equivalent constructions from topological twisting and deconstruction
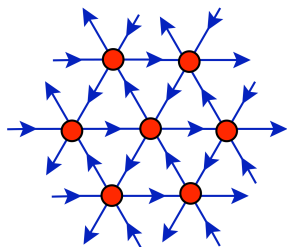

Review:
arXiv:0903.4881

Quick review of twisted lattice $\mathcal{N} = 4$ SYM

**Fields:** 5 complexified links $\mathcal{U}_a$ and $\overline{\mathcal{U}}_a$ in algebra $\mathfrak{gl}(N, \mathbb{C})$

$1 + 5 + 10$ fermions on lattice sites + links + plaquettes

Space-time: A_4^* lattice of 5 links symmetrically spanning 4d
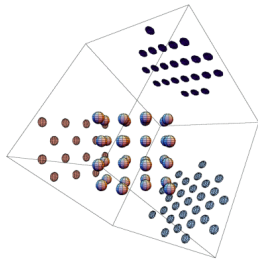

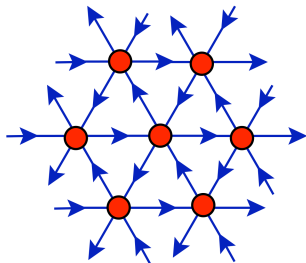

Complexified links $\longrightarrow$ $U(N) = SU(N) \otimes U(1)$ gauge invariance

Must regulate both $SU(N)$ and $U(1)$ flat directions

Two deformations in improved lattice action

SU(N) scalar potential $\propto \mu^2 \sum_a \left(\text{Tr} \left[\mathcal{U}_a \overline{\mathcal{U}}_a \right] - N \right)^2$

Softly breaks susy $\longrightarrow$ $\mathcal{Q}$-violating operators vanish $\propto \mu^2 \to 0$

U(1) plaquette determinant $\sim G \sum_{a<b} \left(\det \mathcal{P}_{ab} - 1 \right)$

Implemented supersymmetrically as Fayet–Iliopoulos D-term potential

Test via Ward identity violations: $\mathcal{Q} \left[\eta \mathcal{U}_a \overline{\mathcal{U}}_a \right] \neq 0$
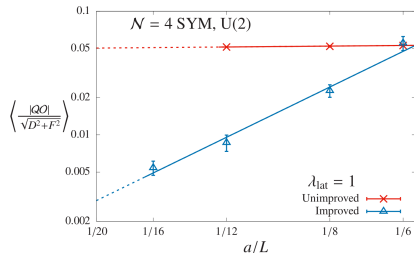

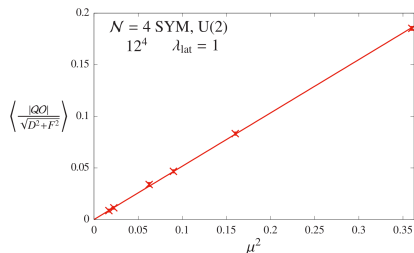

Advertisement: Public code for lattice $\mathcal{N} = 4$ SYM

so that the full improved action becomes

$$S_{\text{imp}} = S'_{\text{exact}} + S_{\text{closed}} + S'_{\text{soft}} \tag{3.10}$$

$$S'_{\text{exact}} = \frac{N}{2\lambda_{\text{lat}}} \sum_n \text{Tr}\left[-\overline{\mathcal{F}}_{ab}(n)\mathcal{F}_{ab}(n) - \chi_{ab}(n)\mathcal{D}^{(+)}_{[a}\psi_{b]}(n) - \eta(n)\overline{\mathcal{D}}^{(-)}_a\psi_a(n) \right.$$
$$\left. + \frac{1}{2}\left(\overline{\mathcal{D}}^{(-)}_a\mathcal{U}_a(n) + G\sum_{a\neq b}(\det\mathcal{P}_{ab}(n) - 1)\,\mathbb{I}_N\right)^2 \right] - S_{\text{det}}$$

$$S_{\text{det}} = \frac{N}{2\lambda_{\text{lat}}}G\sum_n \text{Tr}\left[\eta(n)\right]\sum_{a\neq b}[\det\mathcal{P}_{ab}(n)]\,\text{Tr}\left[\mathcal{U}^{-1}_b(n)\psi_b(n) + \mathcal{U}^{-1}_a(n+\widehat{\mu}_b)\psi_a(n+\widehat{\mu}_b)\right]$$

$$S_{\text{closed}} = -\frac{N}{8\lambda_{\text{lat}}}\sum_n \text{Tr}\left[\epsilon_{abcde}\,\chi_{de}(n+\widehat{\mu}_a+\widehat{\mu}_b+\widehat{\mu}_c)\overline{\mathcal{D}}^{(-)}_c\chi_{ab}(n)\right],$$

$$S'_{\text{soft}} = \frac{N}{2\lambda_{\text{lat}}}\mu^2\sum_n\sum_a \left(\frac{1}{N}\text{Tr}\left[\mathcal{U}_a(n)\overline{\mathcal{U}}_a(n)\right] - 1\right)^2$$

$\gtrsim 100$ inter-node data transfers in fermion operator — non-trivial. . .

To reduce barriers to entry our parallel code is publicly developed at
github.com/daschaich/susy

Evolved from MILC lattice QCD code, presented in arXiv:1410.6971

(I) Thermodynamics on a 2-torus

arXiv:1709.07025

Naive dimensional reduction $\longrightarrow$ 2d $\mathcal{N} = (8,8)$ SYM
with four nilpotent twisted-scalar $\mathcal{Q}^2 = 0$

Study low temperatures $t = 1/r_\beta \longleftrightarrow$ black holes in dual supergravity

For decreasing r_L **at large N**

homogeneous black string (D1)
$\longrightarrow$ localized black hole (D0)

$\updownarrow$

"spatial deconfinement"
signalled by Wilson line P_L
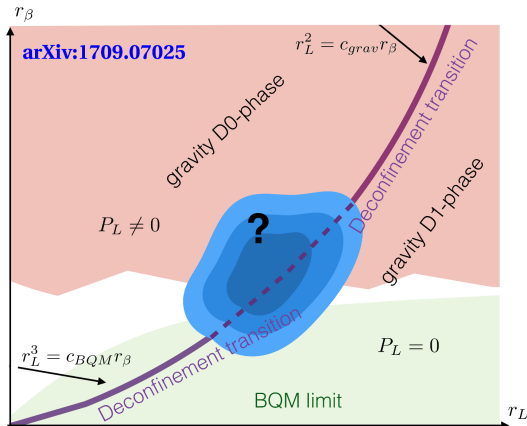

$\mathcal{N} = (8,8)$ SYM lattice phase diagram results
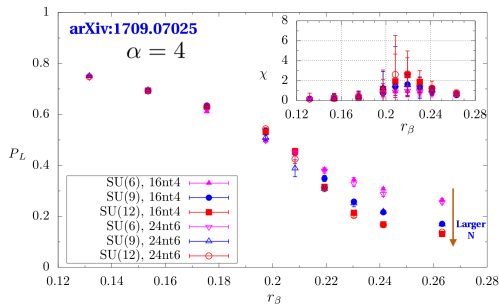

Fix aspect ratio $\alpha = r_L/r_\beta$,
scan in $r_\beta = r_L/\alpha = \beta\sqrt{\lambda}$

Inset shows susceptibility χ
of Wilson line

Lower-temperature transitions
at smaller $\alpha < 1 \longrightarrow$ larger errors

Results consistent with holography
and high-temp. bosonic QM
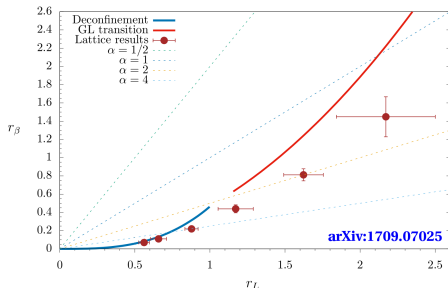

Dual black hole thermodynamics

Holography predicts bosonic action corresponding to dual black holes

$s_{\text{Bos}} \propto t^3$ for large-r_L D1 phase $\qquad$ $s_{\text{Bos}} \propto t^{3.2}$ for small-r_L D0 phase

Lattice results consistent with holography for sufficiently low $t \lesssim 0.4$
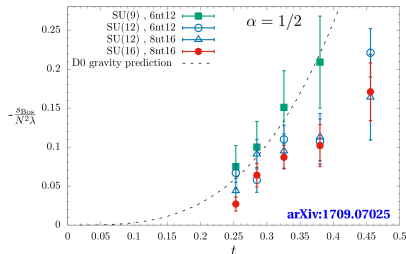

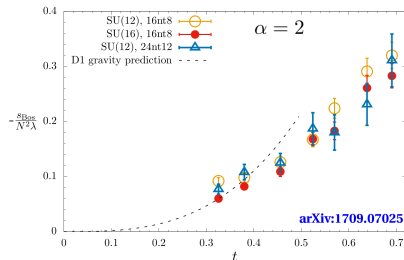

Need larger $N > 16$ to avoid instabilities at lower temperatures

(II) Static potential $V(r)$

Static probes $\longrightarrow$ $r \times T$ Wilson loops $\qquad W(r, T) \propto e^{-V(r)\, T}$

Coulomb gauge trick reduces A_4^* lattice complications
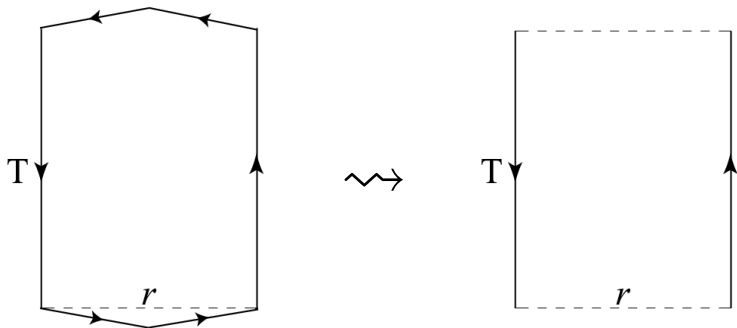

Static potential is Coulombic at all λ

Fits to confining $V(r) = A - C/r + \sigma r \longrightarrow$ vanishing string tension σ

$\Longrightarrow$ Fit to just $V(r) = A - C/r$ to extract Coulomb coefficient $C(\lambda)$
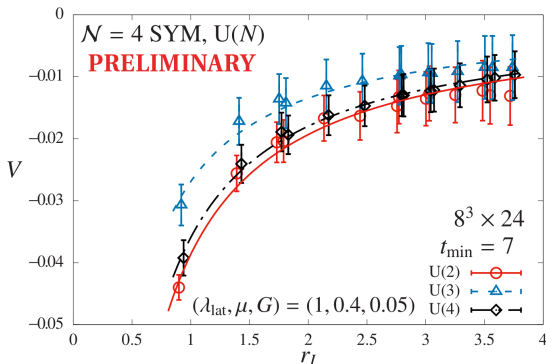

Recent progress: Incorporating tree-level improvement into analysis

Coupling dependence of Coulomb coefficient

Continuum perturbation theory predicts $C(\lambda) = \lambda/(4\pi) + \mathcal{O}(\lambda^2)$

Holography predicts $C(\lambda) \propto \sqrt{\lambda}$ for $N \to \infty$ and $\lambda \to \infty$ with $\lambda \ll N$

$\mathcal{N} = 4$ SYM, U(N)
$L^3 \times 24$
PRELIMINARY

$t_{min} = 7$

U(2), $L = 8$
U(3), $L = 8$
U(4), $L = 8$
U(2), $L = 12$
U(2), $L = 16$
NNLO perturb.

C

$\lambda_{lat} / \sqrt{5}$
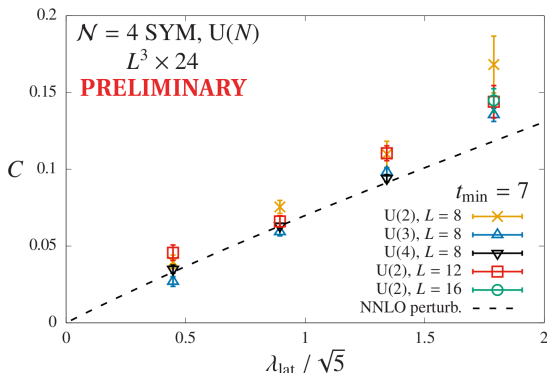

Surprisingly good agreement with perturbation theory for $\lambda_{lat} \leq 4$

(III) Konishi operator scaling dimension

$\mathcal{O}_K(x) = \sum_I \text{Tr}\left[\Phi^I(x)\Phi^I(x)\right]$ is simplest conformal primary operator

Scaling dimension $\Delta_K(\lambda) = 2 + \gamma_K(\lambda)$ investigated through
  perturbation theory (& S duality), holography, conformal bootstrap

Lattice scalars $\varphi(n)$ from polar decomposition of complexified links

$$\mathcal{U}_a(n) \longrightarrow e^{\varphi_a(n)} U_a(n) \qquad \mathcal{O}_K^{\text{lat}}(n) = \sum_a \text{Tr}\left[\varphi_a(n)\varphi_a(n)\right] - \text{vev}$$

$C_K(r) \equiv \mathcal{O}_K(x+r)\mathcal{O}_K(x) \propto r^{-2\Delta_K}$

'SUGRA' is 20' $\mathcal{O}_S \sim \varphi_{\{a}\varphi_{b\}}$
  with protected $\Delta_S = 2$

To handle systemics, comparing
  Direct power-law decay
  Finite-size scaling
  Monte Carlo RG
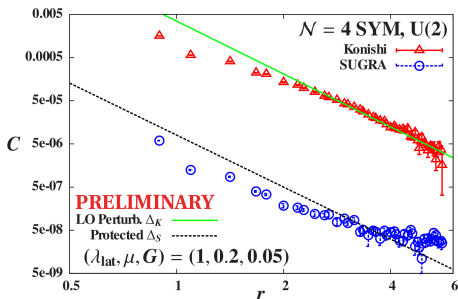

Scaling dimensions from MCRG stability matrix

System as (infinite) sum of operators $H = \sum_i c_i \, \mathcal{O}_i$

Couplings c_i flow under **symmetry-preserving** RG blocking R_b

n-times-blocked system $H^{(n)} = R_b H^{(n-1)} = \sum_i c_i^{(n)} \mathcal{O}_i^{(n)}$

Fixed point defined by $H^\star = R_b H^\star$ with couplings $c_i^\star$

Linear expansion around fixed point defines stability matrix $T_{ij}^\star$

$$c_i^{(n)} - c_i^\star = \sum_k \left.\frac{\partial c_i^{(n)}}{\partial c_k^{(n-1)}}\right|_{H^\star} \left(c_k^{(n-1)} - c_k^\star\right) \equiv \sum_j T_{ik}^\star \left(c_k^{(n-1)} - c_k^\star\right)$$

Correlators of $\mathcal{O}_i$, $\mathcal{O}_k \longrightarrow$ elements of stability matrix   [Swendsen, 1979]

Eigenvalues of $T_{ik}^\star \longrightarrow$ scaling dimensions of corresponding operators

Preliminary Δ_K results from Monte Carlo RG

MCRG stability matrix
  includes both $\mathcal{O}_K^{\text{lat}}$ and $\mathcal{O}_S^{\text{lat}}$

Impose protected $\Delta_S = 2$

Systematic uncertainties from
  different amounts of smearing
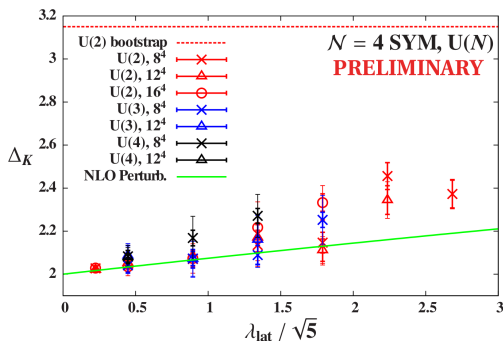

Complication: Twisted $SO(4)_{tw}$ involves only $SO(4)_R \subset SO(6)_R$

$\Longrightarrow$ Lattice Konishi operator mixes with $SO(4)_R$-singlet part
                   of the $SO(6)_R$-nonsinglet SUGRA operator

Current work: Variational analyses to disentangle operators

Recapitulation and outlook

- Lattice promises non-perturbative insights from first principles
- Lattice $\mathcal{N} = 4$ SYM is practical thanks to exact $\mathcal{Q}$ susy
- Public code to reduce barriers to entry

Significant progress toward goals of lattice investigations

- 2d $\mathcal{N} = (8, 8)$ SYM thermodynamics consistent with holography
- 4d static potential Coulomb coefficient $C(\lambda)$ at weak coupling
- Preliminary conformal scaling dimension of Konishi operator

Many more directions are being — or can be — pursued

- Understanding the (absence of a) sign problem
- Systems with less supersymmetry, in lower dimensions, including matter fields, exhibiting spontaneous susy breaking, ...

Numerical approaches to holography, quantum gravity and cosmology

Funding and computing resources

Supplement: Potential sign problem

Observables: $\langle \mathcal{O} \rangle = \dfrac{1}{\mathcal{Z}} \displaystyle\int [d\mathcal{U}][d\overline{\mathcal{U}}] \ \mathcal{O} \ e^{-S_B[\mathcal{U}, \overline{\mathcal{U}}]} \ \text{pf} \, \mathcal{D}[\mathcal{U}, \overline{\mathcal{U}}]$

Pfaffian can be complex for lattice $\mathcal{N} = 4$ SYM, $\text{pf} \, \mathcal{D} = |\text{pf} \, \mathcal{D}| e^{i\alpha}$

Complicates interpretation of $\left\{ e^{-S_B} \, \text{pf} \, \mathcal{D} \right\}$ as Boltzmann weight

RHMC uses phase quenching, $\text{pf} \, \mathcal{D} \longrightarrow |\text{pf} \, \mathcal{D}|$, needs reweighting

$$\langle \mathcal{O} \rangle = \frac{\left\langle \mathcal{O} e^{i\alpha} \right\rangle_{pq}}{\left\langle e^{i\alpha} \right\rangle_{pq}} \qquad \text{with} \ \left\langle \mathcal{O} e^{i\alpha} \right\rangle_{pq} = \frac{1}{\mathcal{Z}_{pq}} \int [d\mathcal{U}][d\overline{\mathcal{U}}] \, \mathcal{O} e^{i\alpha} \, e^{-S_B} \, |\text{pf} \, \mathcal{D}|$$

$\implies$ Monitor $\left\langle e^{i\alpha} \right\rangle_{pq}$ as function of volume, coupling, N

Pfaffian phase dependence on volume and coupling

Left: $1 - \langle\cos(\alpha)\rangle_{pq} \ll 1$ independent of volume and N at $\lambda_{\text{lat}} = 1$

Right: Larger $\lambda_{\text{lat}} \geq 4 \longrightarrow$ much larger phase fluctuations
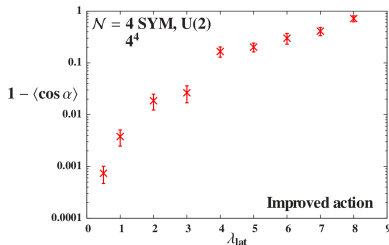

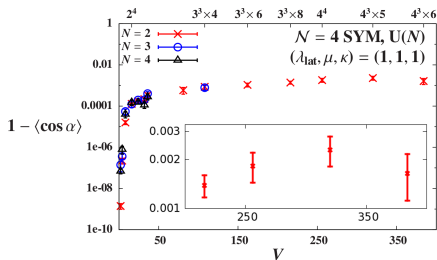

To do: Analyze more volumes and *N* with improved action

Extremely expensive $\mathcal{O}(n^3)$ computation

$\sim$50 hours $\times$ 16 cores for single U(2) 4^4 measurement

Two puzzles posed by the sign problem

Periodic temporal boundary conditions for the fermions
$$\longrightarrow \text{ obvious sign problem, } \left\langle e^{i\alpha} \right\rangle_{pq} \approx 0$$

Anti-periodic BCs $\longrightarrow e^{i\alpha} \approx 1$, phase reweighting negligible
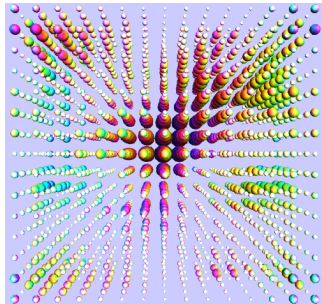

Why such sensitivity to the BCs?

Other $\langle \mathcal{O} \rangle_{pq}$ are nearly identical
for these two ensembles

Why doesn't sign problem
affect other observables?

$\mathcal{N} = 4$ SYM, U(2)
$3^3 \times 4$

Anti-periodic BCs +
Periodic BCs ×

$e^{i\alpha}$

Improved action
(λ, μ, G) **(1, 0.8, 0.1)**

# Backup: Essence of numerical lattice calculations

(Image credit: Claudio Rebbi)

Evaluate observables from functional integral via importance sampling Monte Carlo

$$\langle \mathcal{O} \rangle = \frac{1}{\mathcal{Z}} \int \mathcal{D}U \ \mathcal{O}(U) \ e^{-S[U]}$$

$$\longrightarrow \frac{1}{N} \sum_{i=1}^{N} \mathcal{O}(U_i) \ \text{with uncert.} \ \propto \sqrt{\frac{1}{N}}$$

U are field configurations in discretized euclidean space-time, sampled with probability $\propto e^{-S}$

$S[U]$ is lattice action, ideally real and positive $\longrightarrow \frac{1}{\mathcal{Z}} e^{-S}$ as probability distribution

Backup: More features of lattice calculations

P. Vranas LLNL
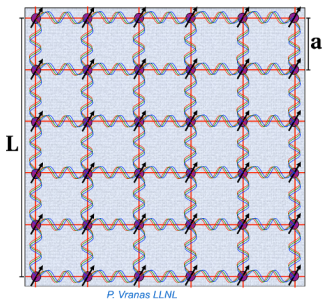

Spacing "a" between lattice sites
$\longrightarrow$ UV cutoff scale $1/a$

Removing cutoff: $a \to 0$ (with $L/a \to \infty$)

Lattice cutoff preserves hypercubic subgroup
$\longrightarrow$ restore Poincaré in continuum limit

Lattice action S defined by bare lagrangian at UV cutoff $1/a$

After generating and saving ensembles $\{U_n\}$ distributed $\propto e^{-S}$
often quick and easy to measure many observables $\langle \mathcal{O} \rangle$

Changing action generally requires generating new ensembles

Backup: Hybrid Monte Carlo (HMC) algorithm

Goal: Sample field configurations U with probability $\frac{1}{\mathcal{Z}} e^{-S[U]}$
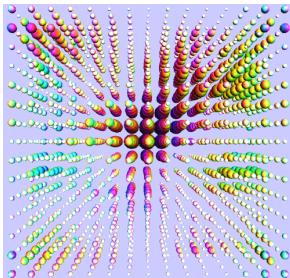

(Image credit: Claudio Rebbi)

HMC is Markov process based on
Metropolis–Rosenbluth–Teller

Fermions $\longrightarrow$ extensive action computation

$\Longrightarrow$ Global updates
using fictitious molecular dynamics

1. Introduce fictitious "MD time" τ
and stochastic canonical momenta for fields

2. Inexact MD evolution along trajectory in $\tau \longrightarrow$ new configuration

3. Accept/reject test on MD discretization error

Backup: Discrete space-time breaks Leibnitz rule

$\left\{ Q_\alpha, \overline{Q}_{\dot\alpha} \right\} = 2\sigma^\mu_{\alpha\dot\alpha} P_\mu = 2i\sigma^\mu_{\alpha\dot\alpha}\partial_\mu$ is problematic

$$\longrightarrow \text{try } \left\{ Q_\alpha, \overline{Q}_{\dot\alpha} \right\} = 2i\sigma^\mu_{\alpha\dot\alpha}\nabla_\mu \text{ for a discrete translation}$$

$$\nabla_\mu \phi(x) = \tfrac{1}{a}\left[\phi(x + a\widehat{\mu}) - \phi(x)\right] = \partial_\mu \phi(x) + \tfrac{a}{2}\partial^2_\mu\phi(x) + \mathcal{O}(a^2)$$

Essential difference between ∂_μ and lattice ∇_μ with $a > 0$

$$\nabla_\mu\left[\phi(x)\eta(x)\right] = a^{-1}\left[\phi(x + a\widehat{\mu})\eta(x + a\widehat{\mu}) - \phi(x)\eta(x)\right]$$
$$= \left[\nabla_\mu\phi(x)\right]\eta(x) + \phi(x)\nabla_\mu\eta(x) + a\left[\nabla_\mu\phi(x)\right]\nabla_\mu\eta(x)$$

Only recover Leibnitz rule $\partial_\mu(fg) = (\partial_\mu f)g + f\partial_\mu g$ when $a \to 0$

$\Longrightarrow$ "Discrete supersymmetry" breaks down on the lattice

(Dondi & Nicolai, "Lattice Supersymmetry", 1977)

Backup: Basic features of $\mathcal{N} = 4$ SYM

Widely used to develop continuum QFT tools & techniques,
from scattering amplitudes to holography

Arguably simplest non-trivial 4d field theory

SU(N) gauge theory with four fermions Ψ^{I} and six scalars Φ^{IJ},
all massless and in adjoint rep.

Action consists of kinetic, Yukawa and four-scalar terms
with coefficients related by symmetries $\longrightarrow$ single coupling $\lambda = g^2 N$

Maximal 16 supersymmetries Q_α^{I} and $\overline{Q}_{\dot\alpha}^{\mathrm{I}}$ $\quad (\mathrm{I} = 1, \cdots, 4)$
transforming under global SU(4) $\sim$ SO(6) R symmetry

Conformal: β function is zero for any λ

Backup: Topological twisting for $\mathcal{N} = 4$ SYM

Intuitive picture — expand 4×4 matrix of supersymmetries

$$\begin{pmatrix} Q_\alpha^1 & Q_\alpha^2 & Q_\alpha^3 & Q_\alpha^4 \\ \overline{Q}_{\dot\alpha}^1 & \overline{Q}_{\dot\alpha}^2 & \overline{Q}_{\dot\alpha}^3 & \overline{Q}_{\dot\alpha}^4 \end{pmatrix} = \begin{aligned} & \mathcal{Q} + \mathcal{Q}_\mu \gamma_\mu + \mathcal{Q}_{\mu\nu} \gamma_\mu \gamma_\nu + \overline{\mathcal{Q}}_\mu \gamma_\mu \gamma_5 + \overline{\mathcal{Q}} \gamma_5 \\ & \longrightarrow \mathcal{Q} + \mathcal{Q}_a \gamma_a + \mathcal{Q}_{ab} \gamma_a \gamma_b \\ & \hspace{3cm} \text{with } a, b = 1, \cdots, 5 \end{aligned}$$

Kähler–Dirac muliplet of 'twisted' supersymmetries $\mathcal{Q}$
         transform with integer spin under 'twisted rotation group'

$$\text{SO}(4)_{tw} \equiv \text{diag}\left[\text{SO}(4)_{\text{euc}} \otimes \text{SO}(4)_R\right] \qquad \text{SO}(4)_R \subset \text{SO}(6)_R$$

Change of variables $\longrightarrow$ closed subalgebra $\{\mathcal{Q}, \mathcal{Q}\} = 2\mathcal{Q}^2 = 0$
         that can be **exactly preserved on the lattice**

Backup: Susy subalgebra from twisted $\mathcal{N} = 4$ SYM

Fields & $\mathcal{Q}$s transform with integer spin under $SO(4)_{tw}$ — no spinors

$$Q_\alpha \text{ and } \overline{Q}_{\dot\alpha} \longrightarrow \mathcal{Q}, \; \mathcal{Q}_a \text{ and } \mathcal{Q}_{ab}$$
$$\Psi \text{ and } \overline{\Psi} \longrightarrow \eta, \; \psi_a \text{ and } \chi_{ab}$$
$$A_\mu \text{ and } \Phi^I \longrightarrow \text{complexified gauge field } \mathcal{A}_a \text{ and } \overline{\mathcal{A}}_a$$
$$(\longrightarrow \text{ U}(N) = \text{SU}(N) \otimes \text{U}(1) \text{ gauge theory})$$

Schematically, under $SO(d)_{tw} = \text{diag}\big[SO(d)_{\text{euc}} \otimes SO(d)_R\big]$

$$A_\mu \sim \text{vector} \otimes \text{scalar} \longrightarrow \text{vector}$$
$$\Phi^I \sim \text{scalar} \otimes \text{vector} \longrightarrow \text{vector}$$

Easiest to see by dimensionally reducing from 5d

$$\mathcal{A}_a = A_a + i\Phi_a \longrightarrow (A_\mu, \phi) + i(\Phi_\mu, \overline{\phi})$$

Backup: Susy subalgebra from twisted $\mathcal{N} = 4$ SYM

Fields & $\mathcal{Q}$s transform with integer spin under SO(4)$_{tw}$ — no spinors

$$Q_\alpha \text{ and } \overline{Q}_{\dot\alpha} \longrightarrow \mathcal{Q}, \mathcal{Q}_a \text{ and } \mathcal{Q}_{ab}$$
$$\Psi \text{ and } \overline{\Psi} \longrightarrow \eta, \psi_a \text{ and } \chi_{ab}$$
$$A_\mu \text{ and } \Phi^I \longrightarrow \text{complexified gauge field } \mathcal{A}_a \text{ and } \overline{\mathcal{A}}_a$$
$$(\longrightarrow \text{U}(N) = \text{SU}(N) \otimes \text{U}(1) \text{ gauge theory})$$

Twisted-scalar supersymmetry $\mathcal{Q}$

correctly interchanges bosonic $\longleftrightarrow$ fermionic d.o.f. with $\mathcal{Q}^2 = 0$

$$\mathcal{Q} \, \mathcal{A}_a = \psi_a \qquad\qquad \mathcal{Q} \, \psi_a = 0$$
$$\mathcal{Q} \, \chi_{ab} = -\overline{\mathcal{F}}_{ab} \qquad\qquad \mathcal{Q} \, \overline{\mathcal{A}}_a = 0$$
$$\mathcal{Q} \, \eta = d \qquad\qquad \mathcal{Q} \, d = 0$$

$\nwarrow$ bosonic auxiliary field with e.o.m. $d = \overline{\mathcal{D}}_a \mathcal{A}_a$

Backup: Details of twisted lattice $\mathcal{N} = 4$ SYM

> Lattice theory looks nearly the same despite breaking $\mathcal{Q}_a$ and $\mathcal{Q}_{ab}$

Covariant derivatives $\longrightarrow$ finite difference operators

Complexified gauge fields $\mathcal{A}_a \longrightarrow$ gauge links $\mathcal{U}_a \in \mathfrak{gl}(N, \mathbb{C})$

$$\mathcal{Q}\,\mathcal{A}_a \longrightarrow \mathcal{Q}\,\mathcal{U}_a = \psi_a \qquad\qquad \mathcal{Q}\,\psi_a = 0$$
$$\mathcal{Q}\,\chi_{ab} = -\overline{\mathcal{F}}_{ab} \qquad\qquad \mathcal{Q}\,\overline{\mathcal{A}}_a \longrightarrow \mathcal{Q}\,\overline{\mathcal{U}}_a = 0$$
$$\mathcal{Q}\,\eta = d \qquad\qquad \mathcal{Q}\,d = 0$$

(geometrically η on sites, ψ_a on links, etc.)

Susy lattice action $(\mathcal{Q}S = 0)$ from $\mathcal{Q}^2 \cdot = 0$ and Bianchi identity

$$S = \frac{N}{4\lambda_{\text{lat}}}\text{Tr}\left[\mathcal{Q}\left(\chi_{ab}\mathcal{F}_{ab} + \eta\overline{\mathcal{D}}_a\mathcal{U}_a - \frac{1}{2}\eta d \right) - \frac{1}{4}\epsilon_{abcde}\,\chi_{ab}\overline{\mathcal{D}}_c\,\chi_{de} \right]$$

Backup: A_4^* lattice from dimensional reduction

Again easiest to dimensionally reduce from 5d,

treating all five gauge links $\mathcal{U}_a$ symmetrically

Start with hypercubic lattice
in 5d momentum space

Symmetric constraint $\sum_a \partial_a = 0$
projects to 4d momentum space

Result is A_4 lattice
$\longrightarrow$ dual A_4^* lattice in real space
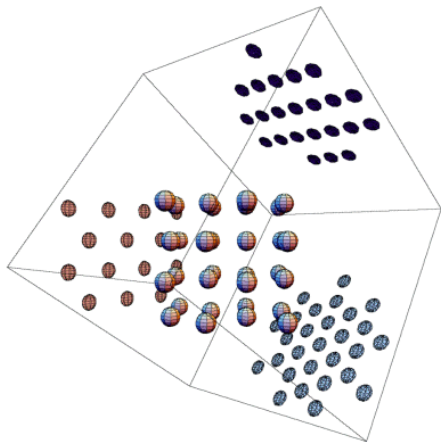

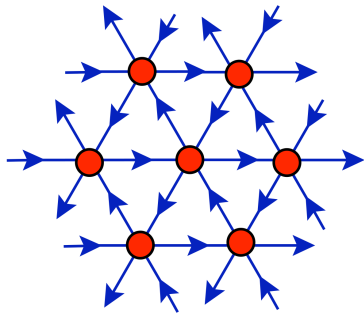

Backup: Twisted SO(4) symmetry on the A_4^* lattice

$A_4^* \sim$ 4d analog of 2d triangular lattice

Basis vectors linearly dependent
and non-orthogonal $\longrightarrow \lambda = \lambda_{\text{lat}} / \sqrt{5}$

Preserves S_5 point group symmetry

S_5 irreps match onto irreps of twisted SO(4)$_{tw}$

$$\mathbf{5} = \mathbf{4} \oplus \mathbf{1}: \quad \psi_a \longrightarrow \psi_\mu, \ \overline{\eta}$$

$$\mathbf{10} = \mathbf{6} \oplus \mathbf{4}: \quad \chi_{ab} \longrightarrow \chi_{\mu\nu}, \ \overline{\psi}_\mu$$

$S_5 \longrightarrow$ SO(4)$_{tw}$ in continuum limit restores $\mathcal{Q}_a$ and $\mathcal{Q}_{ab}$

Backup: Hypercubic representation of A_4^* lattice

In the code it is very convenient to represent the A_4^* lattice as a hypercube plus one backwards diagonal link
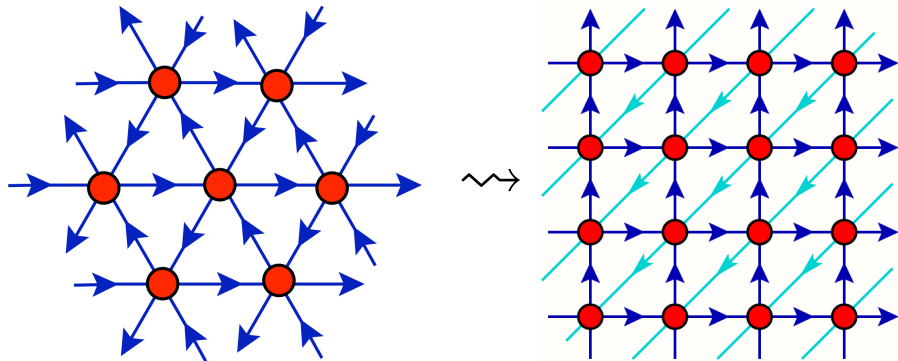

Backup: Analytic results for lattice $\mathcal{N} = 4$ SYM

U(N) gauge invariance $+\ \mathcal{Q}\ +\ S_5$ lattice symmetries
$\longrightarrow$ several significant analytic results

Moduli space preserved to all orders of lattice perturbation theory
$\longrightarrow$ no scalar potential induced by radiative corrections

β function vanishes at one loop in lattice perturbation theory

Real-space RG blocking transformations preserving $\mathcal{Q}$ and S_5
$\longrightarrow$ no new terms in long-distance effective action

Only one logarithmic tuning to recover continuum $\mathcal{Q}_a$ and $\mathcal{Q}_{ab}$

Backup: Problem with SU(*N*) flat directions

$\mu^2/\lambda_{\text{lat}}$ too small $\longrightarrow \mathcal{U}_a$ can move far from continuum form $\mathbb{I}_N + \mathcal{A}_a$

Example: $\mu = 0.2$ and $\lambda_{\text{lat}} = 5$ on $8^3 \times 24$ volume

Left: Bosonic action stable $\sim 18\%$ off its supersymmetric value

Right: Complexified Polyakov ('Maldacena') loop wanders off to $\sim 10^9$
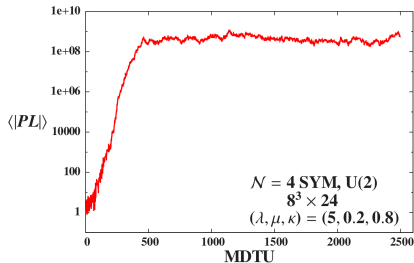

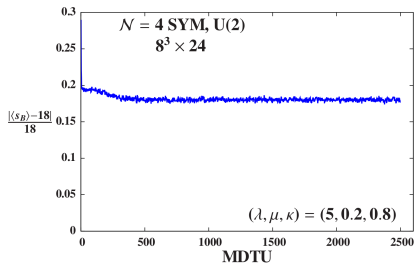

Backup: Details of SU(N) scalar potential

$$S = \frac{N}{4\lambda_{\text{lat}}} \left[\mathcal{Q}\left(\chi_{ab}\mathcal{F}_{ab} + \eta\overline{\mathcal{D}}_a\mathcal{U}_a - \frac{1}{2}\eta d \right) - \frac{1}{4}\epsilon_{abcde}\, \chi_{ab}\overline{\mathcal{D}}_c\, \chi_{de} + \mu^2 V \right]$$

Scalar potential $V = \sum_a \left(\frac{1}{N}\text{Tr}\left[\mathcal{U}_a\overline{\mathcal{U}}_a\right] - 1 \right)^2$ lifts SU(N) flat directions

and ensures $\mathcal{U}_a = \mathbb{I}_N + \mathcal{A}_a$ in continuum limit

Softly breaks $\mathcal{Q}$ — all susy violations $\propto \mu^2 \to 0$ in continuum limit

Ward identity violations, $\langle \mathcal{Q}\mathcal{O}\rangle \neq 0$, show $\mathcal{Q}$ breaking and restoration

Here considering

$$\mathcal{Q}\left[\eta\mathcal{U}_a\overline{\mathcal{U}}_a\right] = d\mathcal{U}_a\overline{\mathcal{U}}_a - \eta\psi_a\overline{\mathcal{U}}_a$$
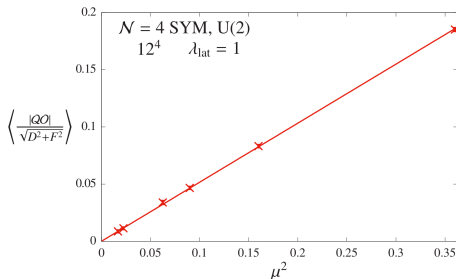

Backup: Problem with U(1) flat directions

Monopole condensation $\longrightarrow$ confined lattice phase

not present in continuum $\mathcal{N} = 4$ SYM
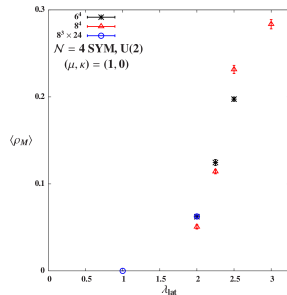

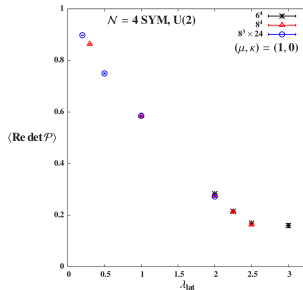

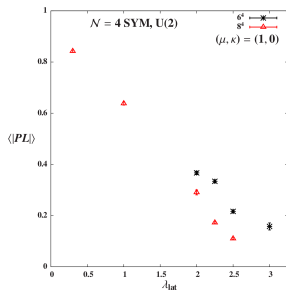

Around the same $\lambda_{\text{lat}} \approx 2\ldots$

Left: Polyakov loop falls toward zero

Center: Plaquette determinant falls toward zero

Right: Density of U(1) monopole world lines becomes non-zero

Backup: Details of U(1) plaq. determinant regulator

$$S = \frac{N}{4\lambda_{\text{lat}}} \left[\mathcal{Q} \left(\chi_{ab} \mathcal{F}_{ab} + \quad \downarrow \quad -\frac{1}{2}\eta d \right) - \frac{1}{4} \epsilon_{abcde} \chi_{ab} \overline{\mathcal{D}}_c \chi_{de} + \mu^2 V \right]$$

$$\eta \left\{ \overline{\mathcal{D}}_a \mathcal{U}_a + G \sum_{a<b} [\det \mathcal{P}_{ab} - 1] \, \mathbb{I}_N \right\}$$

Modify e.o.m. for d to constrain plaquette determinant
$\longrightarrow$ lifts U(1) zero mode & flat directions without susy breaking

Much better than adding
another soft $\mathcal{Q}$-breaking term

$O(a)$ improvement, $\langle \mathcal{Q}\mathcal{O} \rangle \propto (a/L)^2$,
since $\mathcal{Q}$ forbids all dim-5 operators
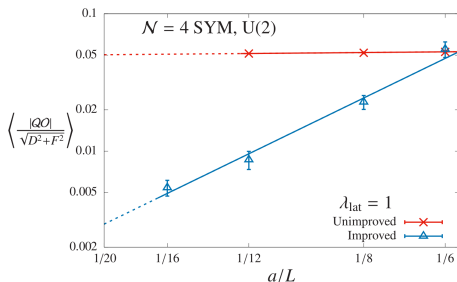

Backup: More on soft supersymmetry breaking

Until 2015 the U(1) regulator was another soft susy-breaking term

$$S_{\text{soft}} = \frac{N}{4\lambda_{\text{lat}}} \mu^2 \sum_a \left(\frac{1}{N} \text{Tr} \left[\mathcal{U}_a \overline{\mathcal{U}}_a \right] - 1 \right)^2 + \kappa \sum_{a<b} |\det \mathcal{P}_{ab} - 1|^2$$

$\longrightarrow$ much larger $\mathcal{Q}$-breaking effects than scalar potential

Left: $\mathcal{Q}$ Ward identity from bosonic action $\langle s_B \rangle = 9N^2/2$

Right: Soft susy breaking suppressed $\propto 1/N^2$
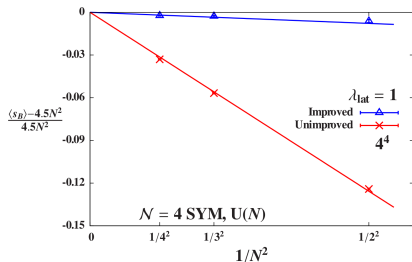

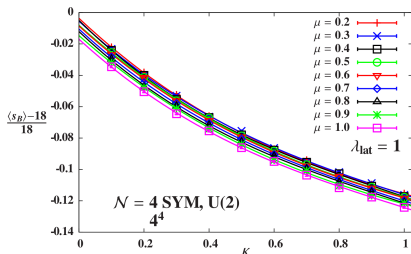

Backup: Supersymmetric moduli space modification

arXiv:1505.03135 introduces method to impose $\mathcal{Q}$-invariant constraints

Modify auxiliary field equations of motion $\longrightarrow$ moduli space

$$d(n) = \overline{\mathcal{D}}_a^{(-)} \mathcal{U}_a(n) \qquad \longrightarrow \qquad d(n) = \overline{\mathcal{D}}_a^{(-)} \mathcal{U}_a(n) + G\mathcal{O}(n)\mathbb{I}_N$$

Including both plaquette determinant and scalar potential in $\mathcal{O}(n)$
over-constrains system $\longrightarrow$ sub-optimal Ward identity violations
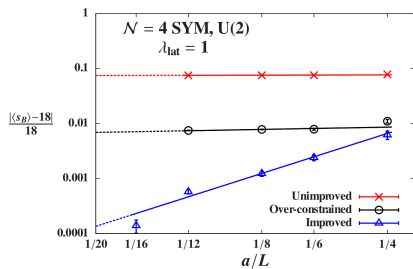

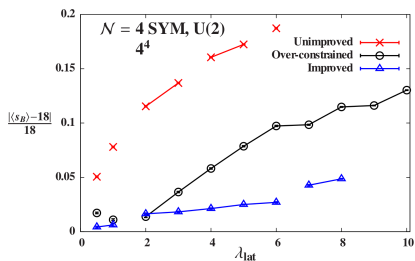

Backup: Restoration of $\mathcal{Q}_a$ and $\mathcal{Q}_{ab}$ supersymmetries

$\mathcal{Q}_a$ and $\mathcal{Q}_{ab}$ from restoration of R symmetry (motivation for A_4^* lattice)

Modified Wilson loops test R symmetries at non-zero lattice spacing

Parameter c_2 may need logarithmic tuning in continuum limit

Results from arXiv:1411.0166 to be revisited using improved action
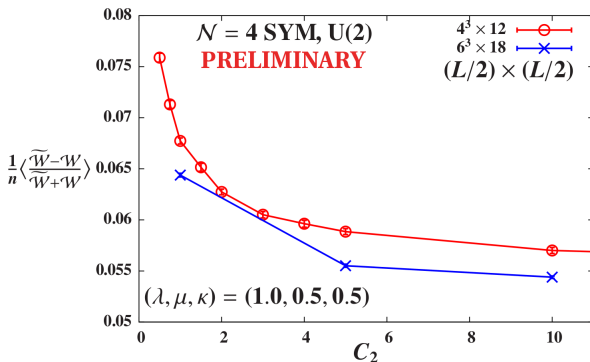

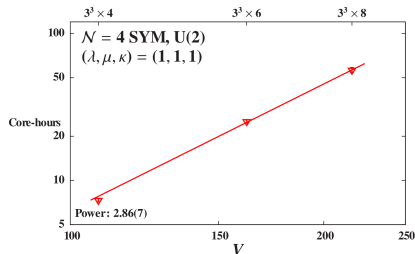

Backup: Code performance—weak and strong scaling

Results from arXiv:1410.6971 to be updated using improved action

Left: Strong scaling for U(2) and U(3) $16^3 \times 32$ RHMC

Right: Weak scaling for $\mathcal{O}(n^3)$ pfaffian calculation (fixed local volume)
$n \equiv 16 N^2 V$ is number of fermion degrees of freedom

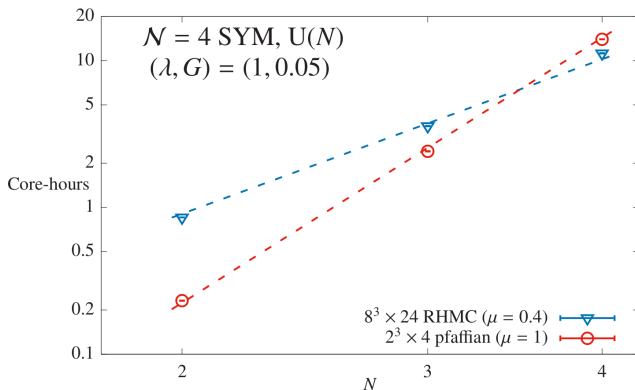

Dashed lines are optimal scaling

Solid line is power-law fit

Backup: Numerical costs for $N = 2, 3$ and 4 colors

Blue: RHMC cost scaling $\sim N^{3.5}$ since condition number increases

Red: Pfaffian cost scaling $\sim N^6$ as expected

$\mathcal{N} = 4$ SYM, U(N)
$(\lambda, G) = (1, 0.05)$

Core-hours

$8^3 \times 24$ RHMC ($\mu = 0.4$)
$2^3 \times 4$ pfaffian ($\mu = 1$)

N

Backup: Dimensional reduction to $\mathcal{N} = (8, 8)$ SYM

Naive for now: 4d $\mathcal{N} = 4$ SYM code with $N_y = N_z = 1$

A_4^* lattice $\longrightarrow$ A_2^* (triangular) lattice

Torus **skewed** depending on $\alpha = N_x/N_t$
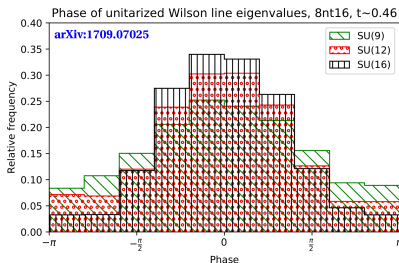

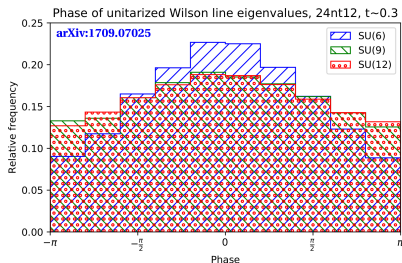

Modular trans. into fundamental domain
     can make skewed torus rectangular

Also need to stabilize compactified links
     to ensure broken center symmetries

arXiv:1709.07025
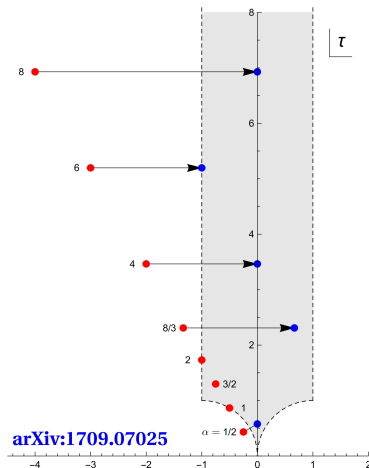

Backup: $\mathcal{N} = (8, 8)$ SYM Wilson line eigenvalues

Check 'spatial deconfinement' through histograms
of Wilson line eigenvalue phases

Left: $\alpha = 2$ distributions more extended as *N* increases
$\longrightarrow$ dual gravity describes homogeneous black string (D1 phase)

Right: $\alpha = 1/2$ distributions more compact as *N* increases
$\longrightarrow$ dual gravity describes localized black hole (D0 phase)

Backup: Static potential is Coulombic at all λ

String tension σ from fits to confining form $V(r) = A - C/r + \sigma r$
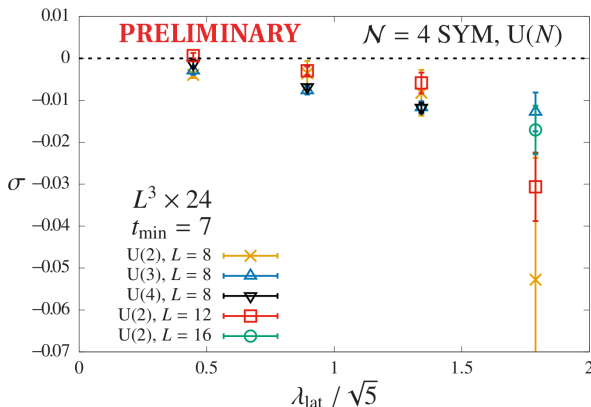

Slightly negative values flatten $V(r_I)$ for $r_I \lesssim L/2$

$\implies \sigma \to 0$ as accessible range of r_I increases on larger volumes

Backup: Discretization artifacts in static potential

Discretization artifacts visible at short distances
where Coulomb term in $V(r) = A - C/r$ is most significant

Right: Highlight artifacts by extracting fluctuations around Coulomb fit

Danger of potential contamination in results for Coulomb coefficient C

Backup: Tree-level improvement

Classic trick to reduce discretization artifacts in static potential

(Lang & Rebbi '82; Sommer '93; Necco '03)

Associate $V(r)$ data with r from Fourier transform of gluon propagator

Recall $\dfrac{1}{4\pi^2 r^2} = \displaystyle\int_{-\pi}^{\pi} \dfrac{d^4k}{(2\pi)^4}\, \dfrac{e^{ir\cdot k}}{k^2}$ where $\dfrac{1}{k^2} = G(k)$ in continuum

On A_4^* lattice $\longrightarrow \dfrac{1}{r_I^2} \equiv 4\pi^2 \displaystyle\int_{-\pi}^{\pi} \dfrac{d^4\widehat{k}}{(2\pi)^4} \dfrac{\cos\left(ir_I\cdot\widehat{k}\right)}{4\sum_{\mu=1}^{4}\sin^2\left(\widehat{k}\cdot\widehat{e}_\mu\,/\,2\right)}$
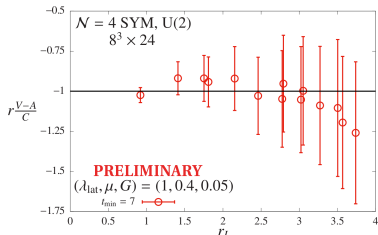

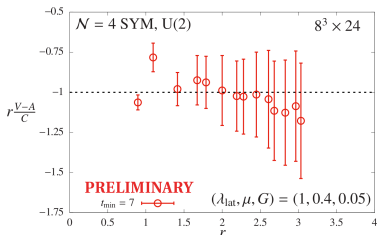

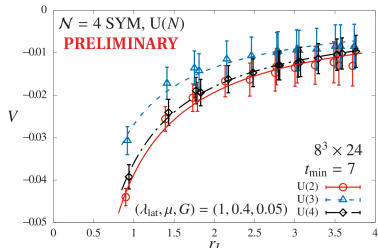

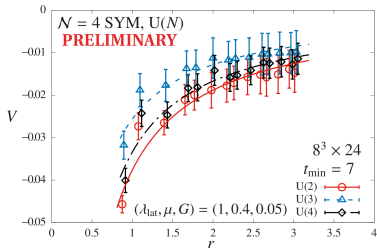

Tree-level perturbative lattice propagator from arXiv:1102.1725

$\widehat{e}_\mu$ are A_4^* lattice basis vectors
while momenta $\widehat{k} = \frac{2\pi}{L}\sum_{\mu=1}^{4} n_\mu \widehat{g}_\mu$ depend on dual basis vectors

# Backup: Tree-level-improved static potential

Tree-level improvement significantly reduces discretization artifacts

Backup: More $\mathcal{N} = 4$ SYM static potential tests

Left: Projecting Wilson loops from U(N) $\longrightarrow$ SU(N) $\implies$ factor of $\frac{N^2-1}{N^2}$

Right: Unitarizing links removes scalars $\implies$ factor of $1/2$

Several ratios end up above expected values

Cause not clear — seems insensitive to lattice volume and μ

Backup: Real-space RG for lattice $\mathcal{N} = 4$ SYM

Must preserve $\mathcal{Q}$ and S_5 symmetries $\longleftrightarrow$ geometric structure

Simple transformation constructed in arXiv:1408.7067

$$\mathcal{U}'_a(n') = \xi \mathcal{U}_a(n)\mathcal{U}_a(n + \widehat{\mu}_a) \qquad\qquad \eta'(n') = \eta(n)$$
$$\psi'_a(n') = \xi\left[\psi_a(n)\mathcal{U}_a(n + \widehat{\mu}_a) + \mathcal{U}_a(n)\psi_a(n + \widehat{\mu}_a)\right] \qquad \text{etc.}$$

Doubles lattice spacing $a \longrightarrow a' = 2a$, with tunable rescaling factor ξ

Scalar fields from polar decomposition $\mathcal{U}(n) = e^{\varphi(n)} U(n)$
    are shifted, $\varphi \longrightarrow \varphi + \log\xi$, since blocked U must remain unitary

$\mathcal{Q}$-preserving RG blocking needed
    to show only one log. tuning to recover continuum $\mathcal{Q}_a$ and $\mathcal{Q}_{ab}$

Backup: Smearing for Konishi analyses

## As for glueballs, smear to enlarge operator basis

APE-like smearing: $\quad - \quad \longrightarrow \quad (1 - \alpha) - \quad + \quad \frac{\alpha}{8} \sum \sqcap$

Staples built from unitary parts of links but no final unitarization

(unitarized smearing — e.g. stout — doesn't affect Konishi)

Average plaquette stable upon smearing (**right**)

while minimum plaquette steadily increases (**left**)
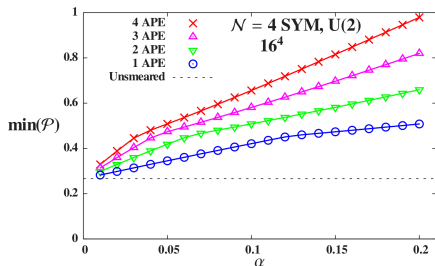

Backup: Lattice superQCD in 2d & 3d

Add fundamental matter multiplets without breaking $\mathcal{Q}^2 = 0$

Proposed by Matsuura [arXiv:0805.4491] and Sugino [arXiv:0807.2683],
first numerical study by Catterall & Veernala [arXiv:1505.00467]
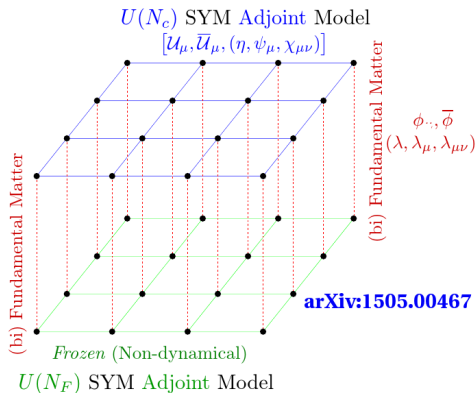

2-slice lattice SYM
    with U(N) × U(F) gauge group

Adj. fields on each slice

Bi-fundamental in between

Set U(F) coupling to zero

$\longrightarrow$ U(N) SQCD in $d-1$ dims.
    with F fund. hypermultiplets

$U(N_c)$ SYM Adjoint Model
$[\mathcal{U}_\mu, \overline{\mathcal{U}}_\mu, (\eta, \psi_\mu, \chi_{\mu\nu})]$

(bi) Fundamental Matter

$\phi_{\cdot\cdot}, \overline{\phi}$
$(\lambda, \lambda_\mu, \lambda_{\mu\nu})$

(bi) Fundamental Matter

arXiv:1505.00467

Frozen (Non-dynamical)
$U(N_F)$ SYM Adjoint Model

Backup: Spontaneous supersymmetry breaking

Auxiliary field e.o.m. $\longrightarrow$ Fayet–Iliopoulos D-term potential

$$d = \overline{\mathcal{D}}_a \mathcal{U}_a + \sum_{i=1}^{F} \phi_i \overline{\phi}_i + r \mathbb{I}_N \quad \longrightarrow \quad S_D \propto \sum_{i=1}^{F} \text{Tr} \left[\phi_i \overline{\phi}_i + r \mathbb{I}_N \right]^2$$

$\langle \mathcal{Q} \eta \rangle = \langle d \rangle \neq 0 \longleftrightarrow \langle 0 | H | 0 \rangle > 0 \longleftrightarrow$ spontaneous susy breaking

Have $N \times F$ degrees of freedom to satisfy $N \times N$ conditions $\langle d \rangle = 0$
